Two overlapping pairs of primers were used in a single polymerase chain reaction (PCR) assay for the simultaneous detection and serotyping of Newcastle disease virus (NDV) and avian paramyxovirus type 1 (APMV-1). This set of primers amplifies a 300-nt fragment of the F gene, part of the fusion glycoprotein, of NDV and APMV-1. The primers were tested with both vaccines and field isolates. No cross-reactions with a variety of avian viruses were detected. The primers are applicable to the identification of NDV in vaccine samples and in infected samples. A simple two-step enzyme-linked immunosorbent assay was used to confirm serogroup specificity. Efficacy of an oral interferon-alpha 2c formulation for the treatment of hairy cell leukemia. The oral formulation of interferon alpha 2c (IFN-alpha 2c) was evaluated for efficacy in 51 previously untreated patients with Hairy Cell Leukemia. Patients received daily oral IFN-alpha 2c at dose levels of 1.5 mg/m² daily (n = 23), 3 mg/m² daily (n = 17), 4 mg/m² daily (n = 7), 5 mg/m² daily (n = 6), and 6 mg/m² daily (n = 5) for 24 weeks. Median follow-up time was 25.2 months (range, 4.0 to 43.6 months). The overall response rate was 79%, with a complete remission rate of 34%. Toxicity was acceptable, and no patient developed human immunodeficiency virus (HIV) antibodies. This oral formulation of IFN-alpha 2c appeared to be effective in hairy cell leukemia. Further study of the 3da54e8ca3
